

Issue: Oracle Tablespace Space Alert – PROD

Tablespace USERS_TBS has reached 90% utilization in PROD database. Please analyze current usage and extend tablespace to avoid application impact.

Steps to Resolve:

- Log into the database server hosting the PROD database.
- Connect to the Oracle database using SQL*Plus or a similar tool.
- Run the query to check current tablespace usage: `SELECT tablespace_name, total_space, used_space, free_space FROM dba_tablespace_usage_metrics WHERE tablespace_name = 'USERS_TBS';`
- Analyze the output to confirm the 90% utilization.
- Identify the segments consuming the most space using: `SELECT segment_name, bytes FROM dba_segments WHERE tablespace_name = 'USERS_TBS' ORDER BY bytes DESC;`
- Determine if any segments can be archived or purged to free up space.
- If extension is necessary, prepare a script to extend the tablespace, e.g., `ALTER DATABASE DATAFILE 'path_to_datafile' RESIZE new_size;`
- Execute the script to extend the tablespace.
- Verify the extension by re-running the tablespace usage query.
- Document the changes made and notify the relevant stakeholders about the resolution.

Technical Details:

Affected system: PROD Oracle Database. Current tablespace 'USERS_TBS' utilization is at 90%. No errors reported in logs, but potential application impact if not resolved. Configuration settings for tablespace need to be reviewed post-resolution.

Complete Description:

Incident reported for Oracle Tablespace Space Alert in PROD. The USERS_TBS tablespace has reached 90% utilization, which could impact application performance. Technical analysis confirms the need for extension or cleanup. Recommended actions include checking current usage, identifying large segments, and extending the tablespace as necessary.
