

Issue: Socket read interrupted on hostname14

The incident involves a socket read interruption error on hostname14, indicated by the error pattern `com.ibm.websphere.ce.cm.staleconnectioexception:IO` error.

Steps to Resolve:

- Review the System Error Log on hostname14 for detailed error messages.
- Check the WebSphere configuration settings for any misconfigurations.
- Restart the WebSphere application server on hostname14.
- Monitor the network connectivity to ensure there are no interruptions.
- Verify if there are any recent changes made to the system that could have caused the issue.
- Check for any updates or patches available for the WebSphere application server.
- Review the application code for potential issues that could lead to socket read interruptions.
- Increase the socket timeout settings in the WebSphere configuration.
- Test the application after making changes to ensure the issue is resolved.
- Document the incident resolution steps and update the incident record in ServiceNow.

Technical Details:

The incident is related to a socket read interruption error on hostname14, specifically indicated by the error pattern `com.ibm.websphere.ce.cm.staleconnectioexception`. The affected system is the WebSphere application server. No specific logs or configurations were provided, but the error suggests issues with network connectivity or application server settings.

Complete Description:

The incident involves a socket read interruption error on hostname14, indicated by the error pattern `com.ibm.websphere.ce.cm.staleconnectioexception:IO` error. The affected system is the WebSphere application server. To resolve this issue, the following steps should be taken: review the system error log, check configuration settings, restart the application server, monitor network connectivity, verify recent changes, check for updates, review application code, increase socket timeout settings, test the application, and document the resolution steps.
